[Abstract submitted to 2nd Annual International Conference on Solid-State Lasers
for Application to Inertial Confinement Fusion (ICF), Paris, France (1996)]

Abstract

The effect of a change in the system parameters upon the one micron laser's energy and beam quality will be discussed. The parameters varied in the study were the optical losses, the gain and gain profile of the amplifiers. Additionally, the effect upon energy and beam quality as a function of slab count and position will be presented.
